### Product description

The AC / DC sensitive residual current monitor RCMA475LY is designed for monitoring earthed power supply systems (TN and TT systems) where DC fault currents or residual currents continuously greater than zero may occur. These are in particular loads containing six-pulse rectifiers or one way rectifiers with smoothing, such as converters, battery chargers, construction site equipment with frequency-controlled drives.

The prewarning stage (50 % of the set response value  $I_{\Delta n1}$ ) allow to distinguish between prewarning and alarm. Since the values are measured with measuring current transformers, the device is nearly independent of the load current and the nominal voltage of the system.

### Application

- AC / DC sensitive residual current monitoring in earthed two, three or four conductor systems (TN and TT systems)
- AC / DC sensitive current monitoring of single conductors de-energised under normal conditions (e.g. N and PE conductors)
- Variable-speed drives
- Uninterruptible power supply systems (UPS)

### Function

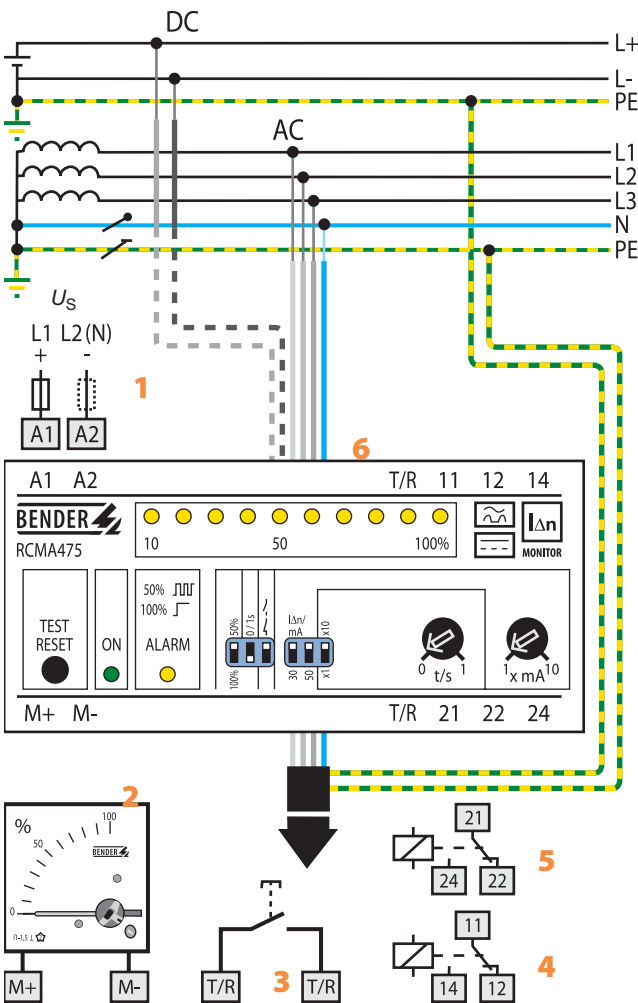

Residual current monitoring takes place via an internal measuring current transformer. When the current respectively the residual current exceeds the set response value, the alarm LED lights and the associated alarm relay switches when the set response delay has elapsed.

The alarm messages are stored. The fault memory can be reset by pressing the reset button. The device function can be tested using the test button.

The currently measured value in per cent related to the set response value is indicated on the LED bar graph indicator.
