Product description

The AC / DC sensitive residual current monitoring module is suitable for fault current monitoring in transformerless photovoltaic inverters where direct and / or alternating fault currents are likely to occur the value of which is constantly greater than zero.

Function

Residual current monitoring is carried out using an internal measuring current transformer. The r.m.s. value is calculated by summing up the DC components included in the residual current and the AC components that are below the cut-off frequency. A signal in proportion to the residual current is available at the module output (X1). In addition, values outside the measuring range are signalled by a switching output (X12).

The control input (X10) will also be queried. Depending on the HIGH / LOW sequence, a reset of the RCMB100 will be activated with / without subsequent calibration.
